

The remote monitoring of equipment functions and parameters is a requirement of an increasingly IOT-oriented market. This is how **Ortea Cloud**, Ortea's new platform for remote voltage stabiliser monitoring, was born. It replaces and surpasses "Stabimon", the first monitoring software designed and developed more than ten years ago by Ortea. In addition to the **Sirius range**, Ortea Cloud is also available for the **Orion Plus range**.

Ortea Cloud makes it possible to:

- **Remotely monitor (via PC, Tablet or Smartphone) electrical and temperature values, display active alarms/archived alarms and produce multifunctional graphs, allowing the operator to produce accurate and well-defined analyses of the operation of their plant.**
- **Download the data directly from the platform by selecting values and time intervals using filters.**
- **In the event of alarm activation/termination, the system sends an e-mail alert, allowing a quick verification and subsequent resolution of the problem.**
- **Activate any maintenance in real time.**

Ortea Cloud is offered in two versions: the **basic version** (Ethernet) or the **basic version + modem** (should it not be possible to connect the stabiliser to a network). Access to the platform is free for the first year and there are no additional costs for software licences and updates. Thereafter, an annual or three-year renewal fee is required.

Our Power Quality solutions:

- VOLTAGE STABILISERS
- SAG COMPENSATOR
- LV TRANSFORMERS
- PFC SYSTEMS
- ACTIVE HARMONIC FILTERS
- ENERGY EFFICIENCY
- SMART DEVICES
